**USAID**  
FROM THE AMERICAN PEOPLE

## Outline

- Objective
- The Energy Challenge
- Key Interventions
- Selected Success Stories
- Coping with the Energy Challenge: A Toolkit
- Conclusion

**USAID**  
FROM THE AMERICAN PEOPLE

## Objective

- To discuss the energy challenges faced by most countries that are net energy importers (specially poor ones)
- To inform and provide guidance to USAID Missions and Regional Bureaus on what type of interventions should be considered to address some of the key energy challenges
- To illustrate successful interventions
- To introduce a structured approach to understand possible types of interventions to cope with high energy prices

**USAID**  
FROM THE AMERICAN PEOPLE

## Outline

- Objective
- **The Energy Challenge**
- Key Interventions
- Selected Success Stories
- Coping with the Energy Challenge: A Toolkit
- Conclusion

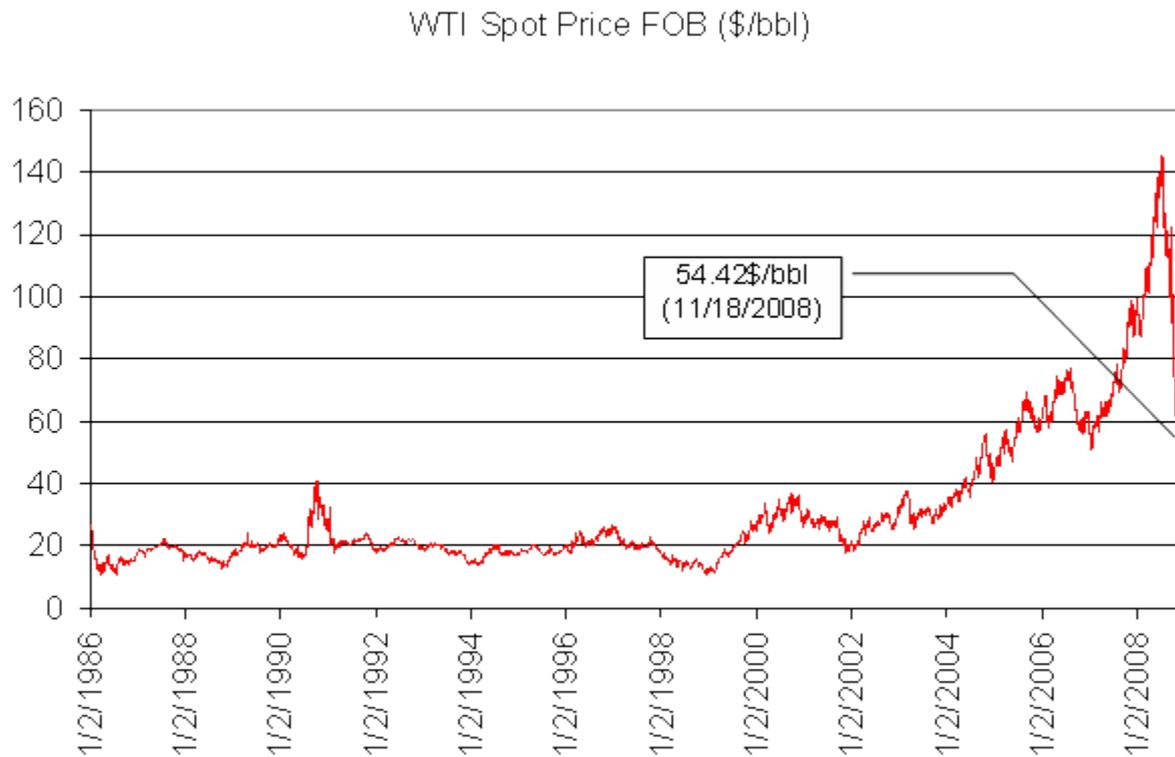

## The energy sector poses different challenges to developing countries

- **Price level and variability:** Energy prices volatile and likely trending upward
- **Energy Security:** Many LDCs net importers. Energy Security and foreign exchange rate concerns
- **Domestic Stability:** High energy prices can result in violent protests
- **Fiscal space and human capital development:** High energy subsidies creates significant government budget constraints, shifting resources from social and basic infrastructure programs
- **Economic growth:** Government often involved with energy production/distribution prone to corruption, threatening the reliability and quality of supply, thus imposing significant costs on an economy
- **Climate change:** Energy consumption is directly linked with global climate change

**Challenge: how to organize and manage the energy sector so as to deliver the most benefits at the lowest cost**

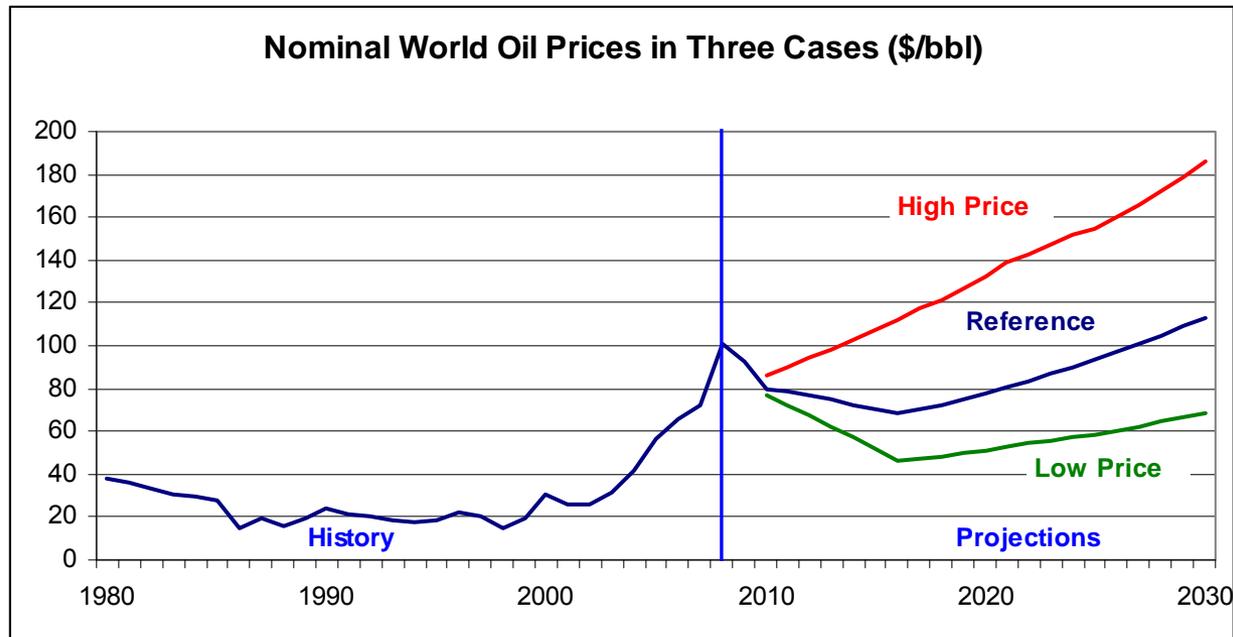

**After a continuous increase since 2001 from 20 \$/bbl to 140\$/bbl, oil price has started to decline...**

Source: EIA

...However, high oil prices and economic effects are here to stay..

Source: EIA. International Energy Outlook. September 2008

The EIA defines the three cases based in four factors: growth in world liquids demand, high production costs for accessible non-OPEC conventional liquids resources, OPEC investment and production behavior, and the cost and availability of unconventional liquids supply.

## ...While Energy Access Varies Greatly by Region

<i>Region (2005) (in Developing Countries)</i>	<i>Electricity Coverage (%)</i>	<i>Un-served Population (millions)</i>
• Sub-Saharan Africa	26	547
• North Africa	95	7
• South Asia	52	706
• East Asia & China	88	223
• Middle East	78	41
• Latin America	90	45
<b>TOTAL</b>	<b>75</b>	<b>1,577</b>

## Poorer countries suffer the most under higher oil prices...

- All Very Low Income countries and 70% of Low Income Countries are Net oil importers
- Poorer countries have higher percentage of Net Oil Import/GDP and therefore are more vulnerable to an oil shock.
- Poorer countries have weaker economies to cushion the negative impacts

### Percentage Change in GDP by a US\$10 a Barrel Rise in Oil Prices\*

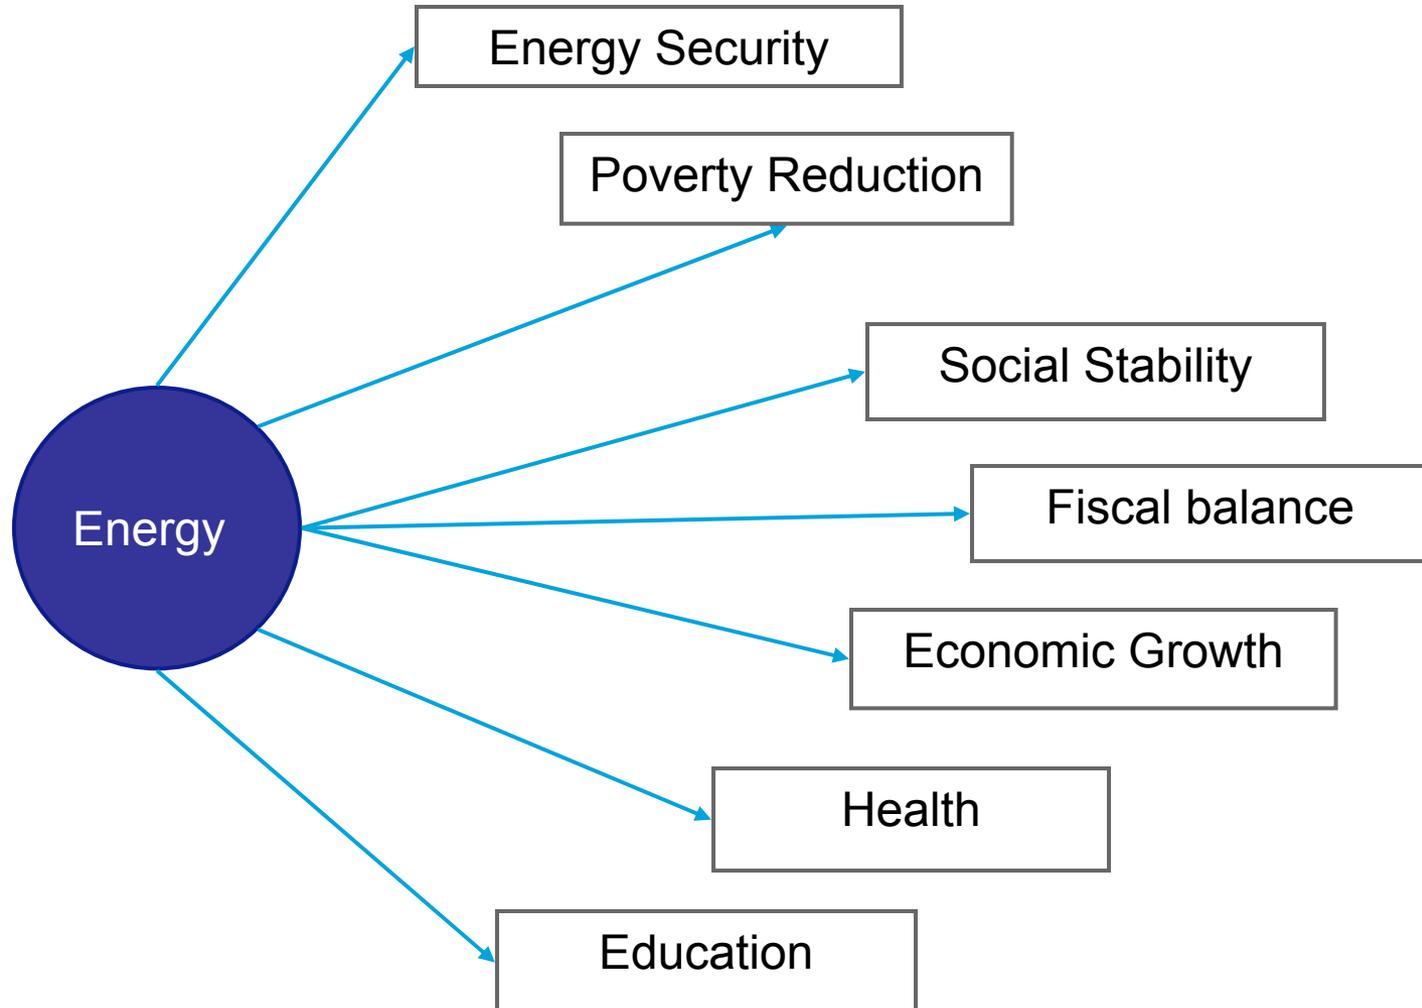

<i>Per Capita income (1999-2001 US\$)</i>	<i>Net Oil Import/Export as % of GDP</i>	<i>% Change in GDP</i>
<i>Net Oil Importers</i>		
Very Low Income <300 [18]	-4.52	-1.47
Low Income >300 and <900 [22]	-3.75	-0.76
Middle Income >900 and <9000 [36]	-2.72	-0.56
High Income >9000 [21]	-1.49	-0.44
<i>Net Oil Exporters</i>		
Low Income >300 and <900 [10]	21.88	+5.21
Middle Income >900 and <9000 [17]	22.96	+4.16
High Income >9000 [7]	19.93	+1.50

\* Base Oil price of US\$23.55

Source: *The Impact of Higher Oil Prices on Low Income countries and on the Poor. ESMAP (2005)*

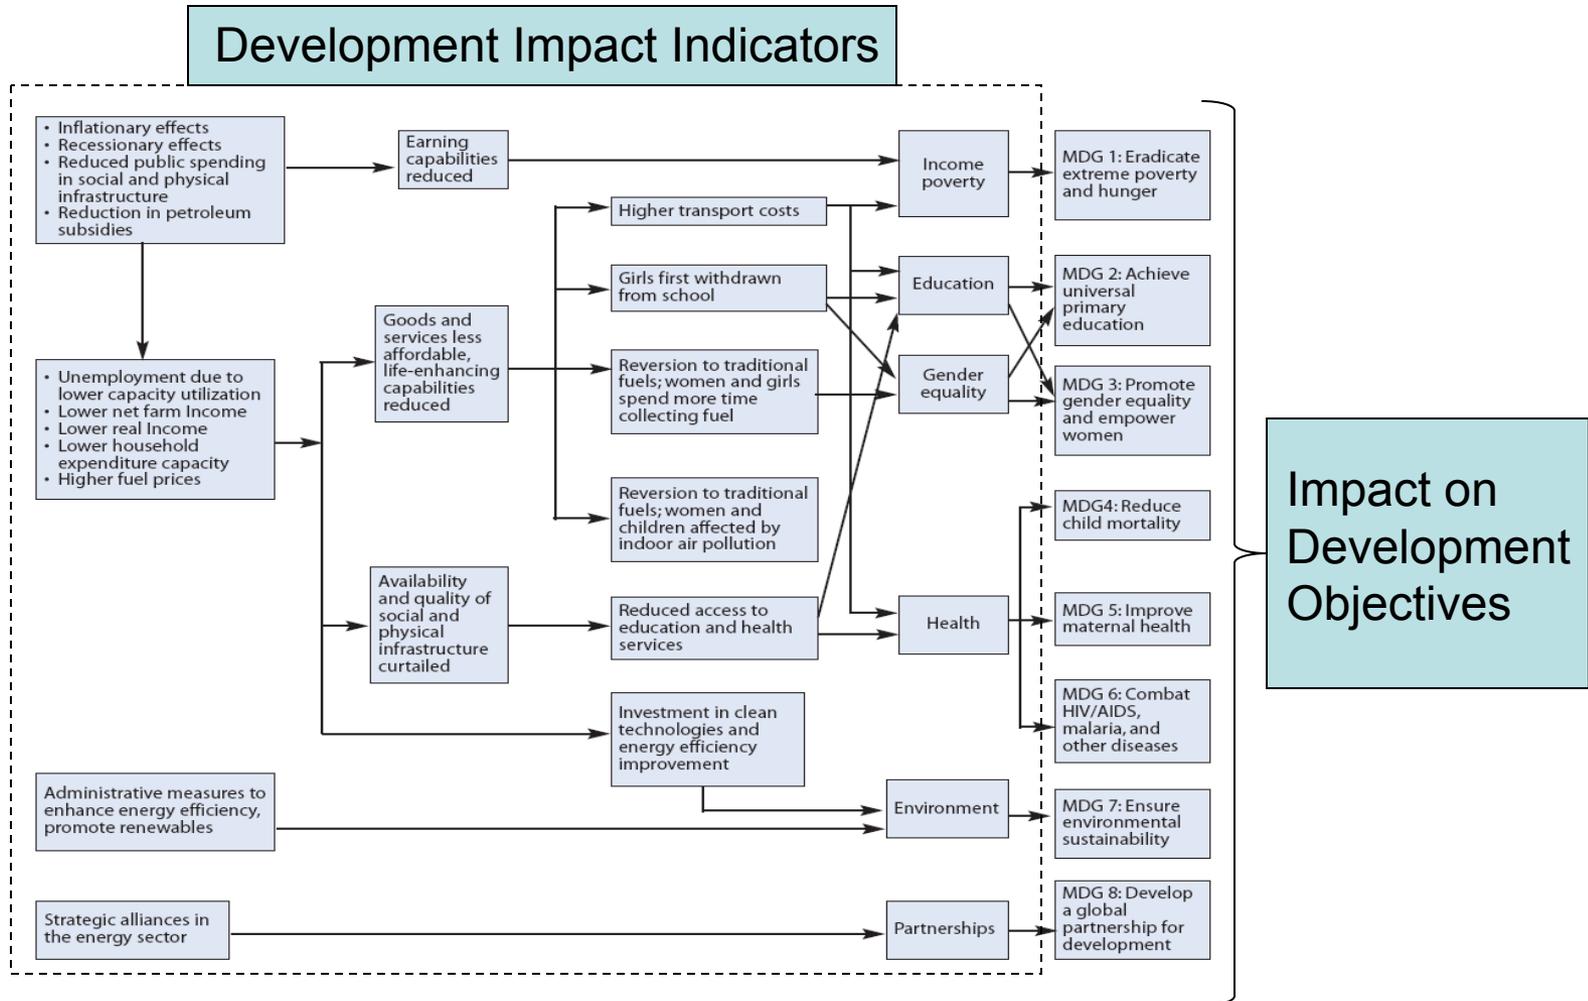

...Posing serious challenges to a wide range of development objectives...

## ...Through a variety of causal-effect linkages

**USAID**  
FROM THE AMERICAN PEOPLE

## The Energy Challenge

### Energy Security

- Net importers risk that energy supplies or access to lower cost supplies will be disrupted

Country examples:

- Georgia's risky dependence on Russian oil & gas
- Latin American dependency on Venezuela's subsidized oil
- Restriction of Imported Bolivian Natural Gas to Brazil
- South Africa electricity rationing its exports to Mozambique, Zimbabwe, Namibia and Swaziland

## Social Stability

- High energy prices fuel violent public protests and threaten social stability.
- Recent examples:
  - Guinea: In 2007, energy price increases of 63% resulted in violent protests and 200 people dead.
  - Lebanon: In May 2008, protesters and police clash in riots against rising fuel prices, leaving five people killed and forty injured.
  - Indonesia: Daily protests erupted after Indonesia withdrew energy subsidies in June 2008 and fuel prices jumped 30%.
  - Nepal: The pump price of gasoline and diesel jumped 25% in June 2008, sparking street protests.

**USAID**  
FROM THE AMERICAN PEOPLE

## The Energy Challenge

Guinea

Indonesia

Lebanon

Nepal

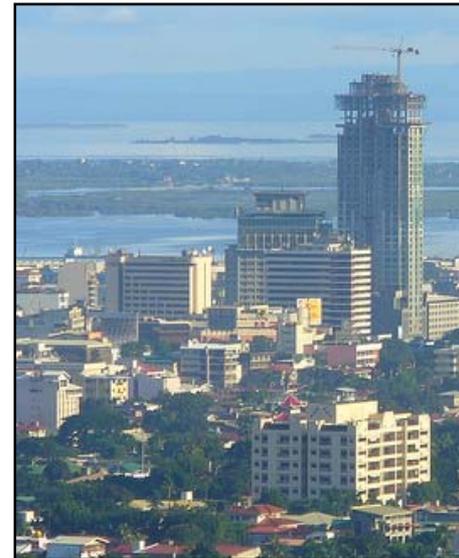

## Fiscal Balance

- High energy subsidies creates significant government budget constraints, shifting resources from social and basic infrastructure programs.
- Country examples:
  - Malaysia: Fuel subsidies cost the govt. \$17 billion this year, four times more than what it pays for national defense, education and health care.
  - India: Power subsidies cost the Government of India \$3 billion in 1999. Theft alone cost Indian states more than \$4.4 billion a year.

## Economic Growth

- Energy is critical for manufacturing, tourism, ICT, etc.
- Country examples:
  - Philippines: The Visayas region is suffering from electricity shortages and high prices.
    - Tourism on Panay Island is suffering.
    - Foreign call centers and IT business are not establishing new offices in Cebu.
  - Pakistan: Power rationing and shortages in Karachi have had serious impacts on industry.
    - 16 major textile units and 15,000 cottage industrial units closed down.
    - Losses caused by load shedding as of mid 2008 were around \$400 billion.

**Downtown Cebu**

## Health & Education

- Reliable electricity is critical for operation of medical equipment and refrigeration of vaccines, medicine, and blood supplies.
- Energy is needed for lighting and heating of schools
- Country examples:
  - Haiti: Hospital Petit Goave goes without electricity due to high fuel prices. The hospital's blood bank and supplies including HIV rapid test kits, reagents, blood, vaccines, etc. are sometimes stored at room temperature.
  - Tajikistan: Energy shortages closed down schools for two months during the 2007/8 winter; school attendance plunged. Most of the nation's 3800 primary schools and 400 kindergartens have "almost no, or very limited, heating."

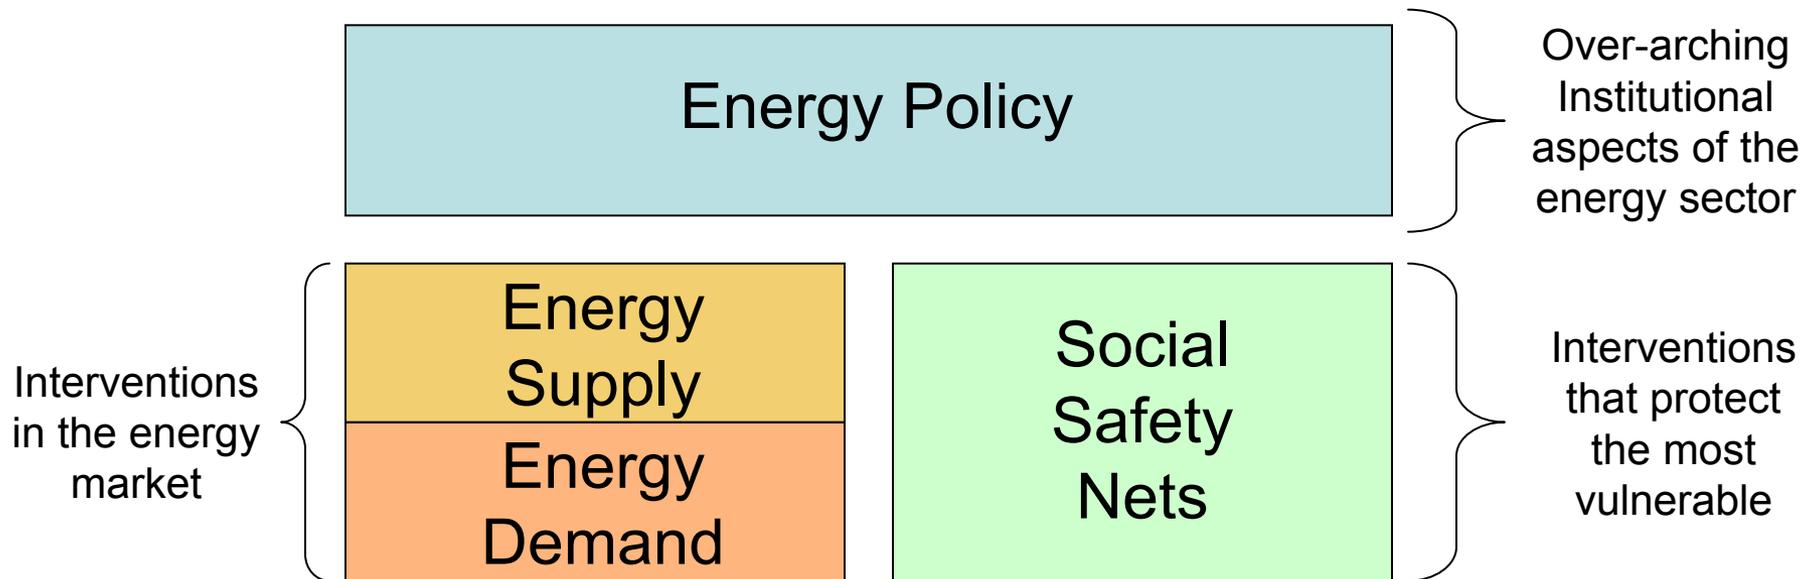

**USAID**  
FROM THE AMERICAN PEOPLE

## Outline

- Objective
- The Energy Challenge
- **Key Interventions**
- Selected Success Stories
- Coping with the Energy Challenge: A Toolkit
- Conclusion

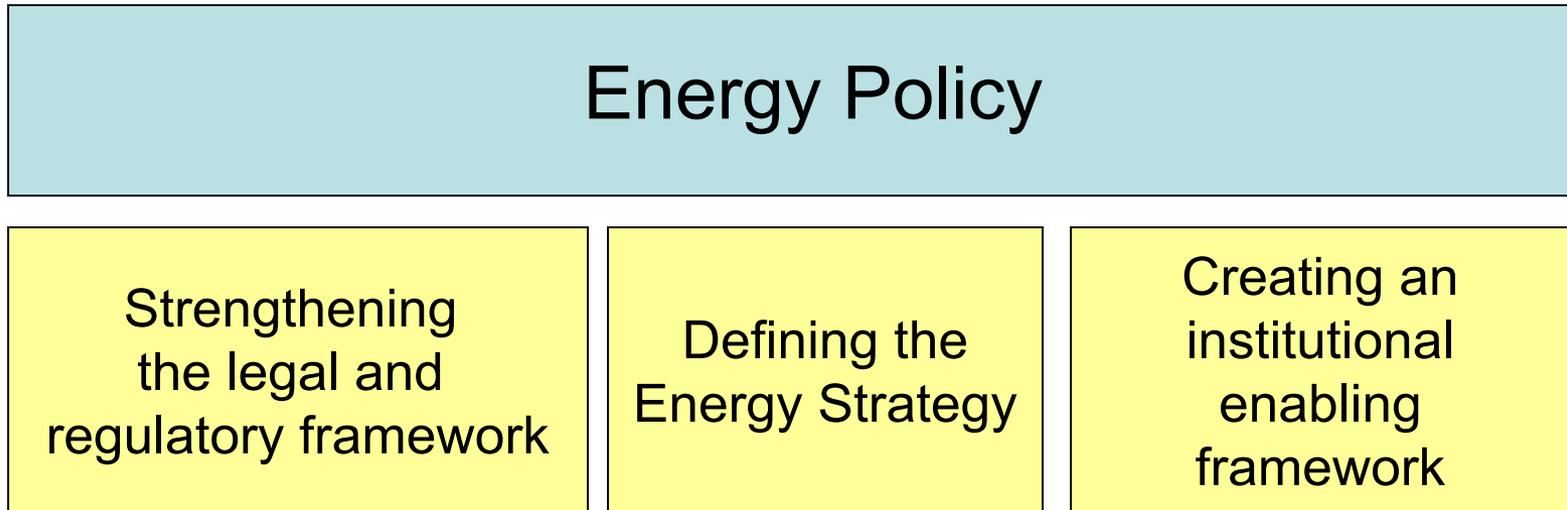

**Key Interventions are structured in four key areas: Energy Policy, Energy Market (Supply and Demand) and Social Safety Nets**

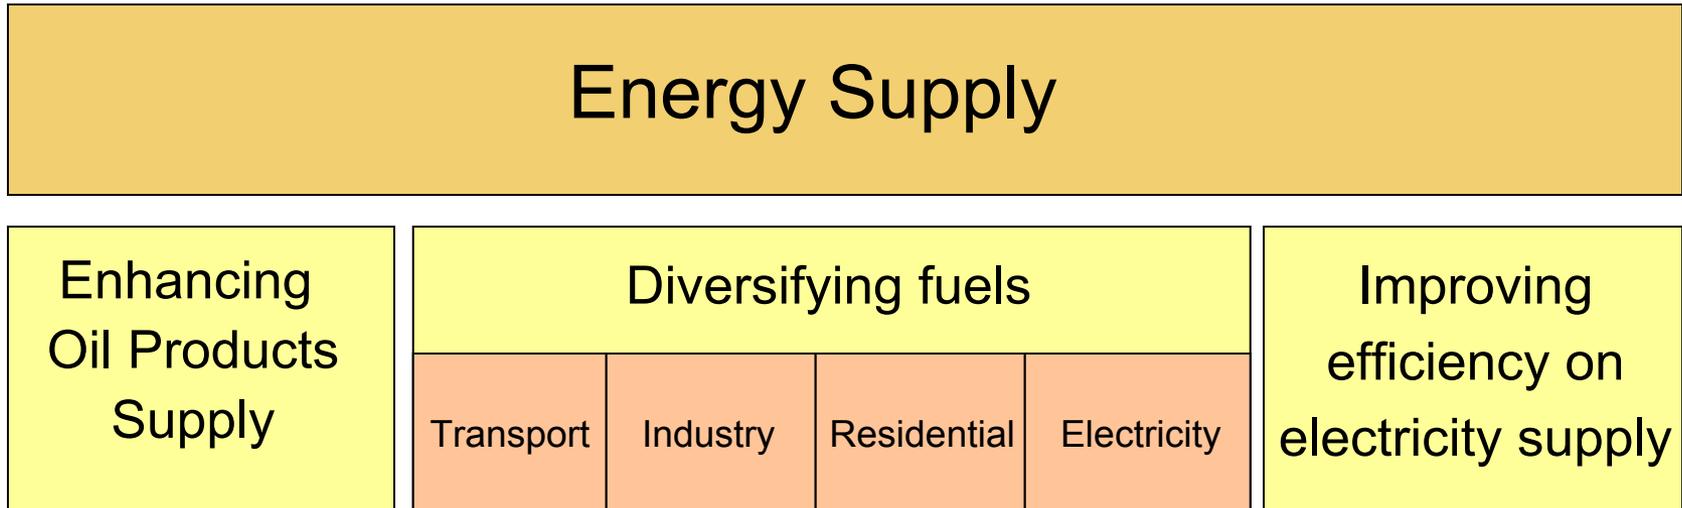

Energy Policy	
Energy Supply	Social Safety Nets
Energy Demand	

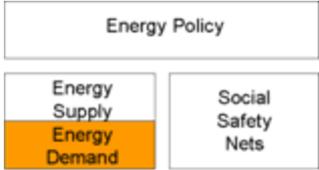

**Interventions in Energy Policy aim to improve the long-term energy sector performance, planning, and reform sustainability**

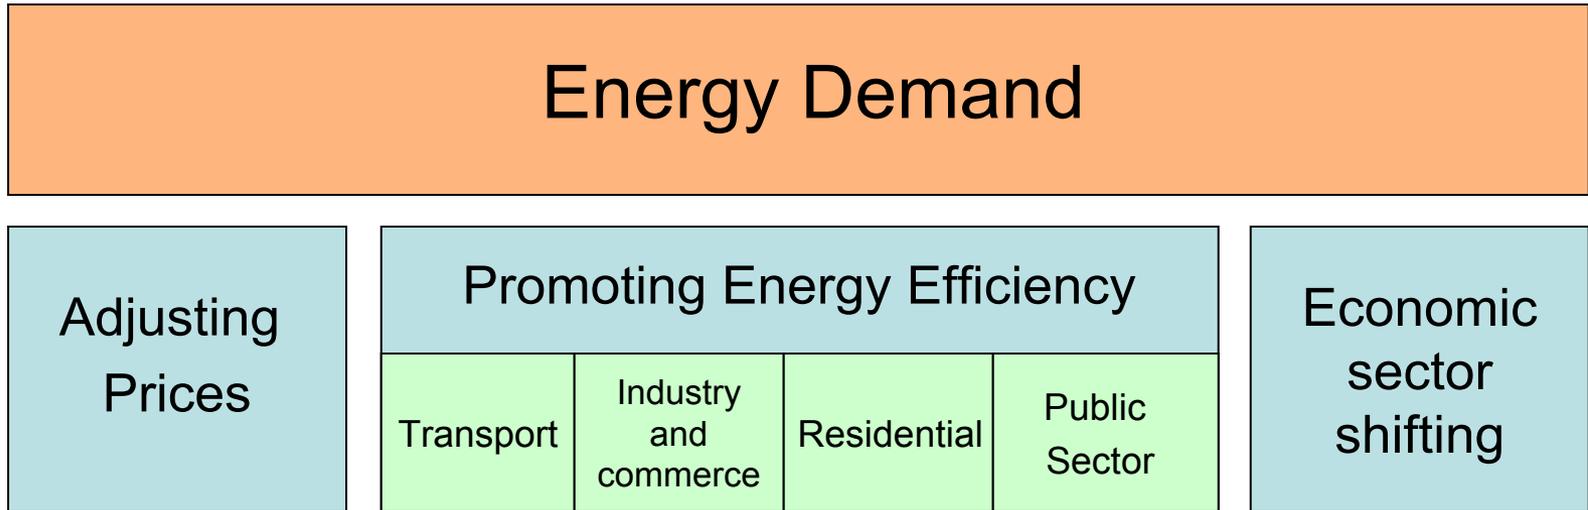

**Energy Supply interventions look at ways to improve the energy supply conditions (quantity, price and risk) to the country**

**Energy Demand interventions explore approaches to reduce the energy intensity from the demand side**

**USAID**  
FROM THE AMERICAN PEOPLE

## Key Interventions

Energy Policy

Energy  
Supply  
Energy  
Demand

Social  
Safety  
Nets

**Social Safety Nets Interventions aim to protect the most vulnerable against high energy prices, promoting the access and affordability of energy services**

### Social Safety Nets

Promoting access  
to energy services

Designing  
appropriate tariffs

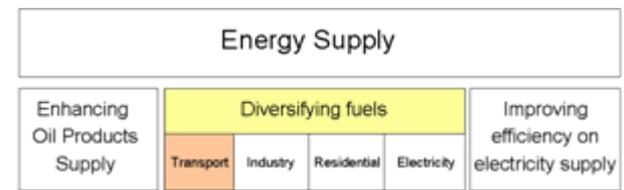

Implementing  
targeted  
subsidies

**USAID**  
FROM THE AMERICAN PEOPLE

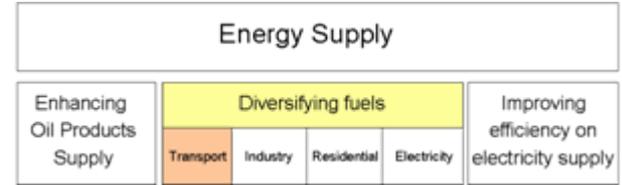

## Outline

- Objective
- The Energy Challenge
- Key Interventions
- **Selected Success Stories**
- Coping with the Energy Challenge: A Toolkit
- Conclusion

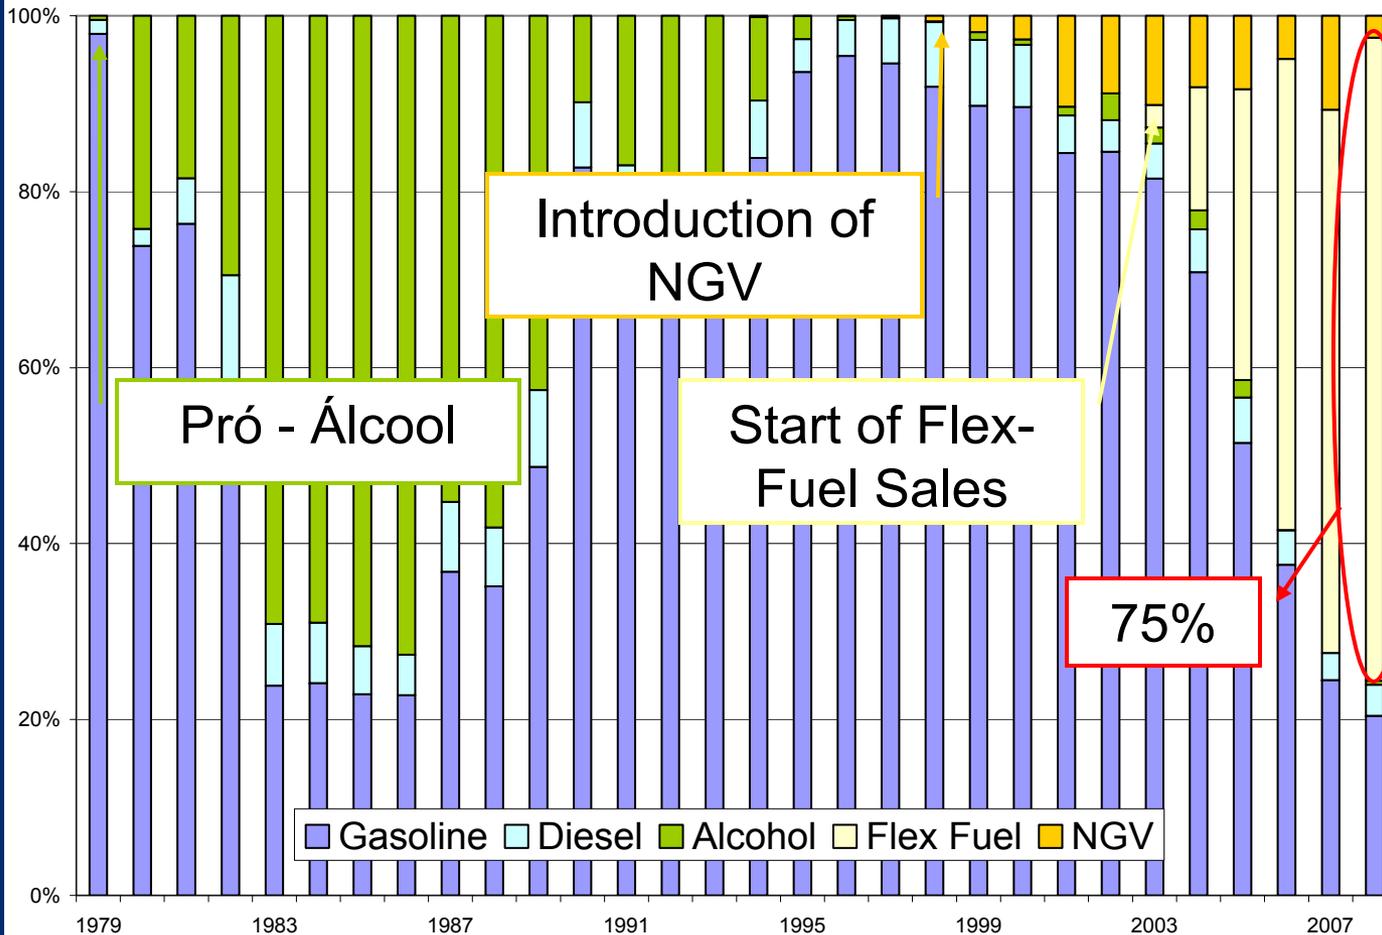

## Brazil – Diversifying energy consumption in the transport sector...

- **Oil Shocks 1970s** → Brazil to **promote diversification** energy consumption **transport** sector through the introduction of **Biofuels** and **Natural Gas**
- **National Alcohol Program (*Pró-Álcool*)**. Started in **1975**
  - **Mandatory blend** of ethanol fuel with gasoline (10%-22% 1976-2007, **25%** since 2007)
  - **Guaranteed remuneration** to ethanol producer (no longer applied)
  - Ethanol **price** lower than gasoline price (no longer applied)
  - Low-interest **loans** for ethanol producers (no longer applied)
- **Development of Natural Gas Vehicles (NGVs)**. Started in **1999**
  - Public investment in **refueling points**
  - Initial conversion of **public transport** fleets
  - **Subsidies** to **conversion** of Gasoline vehicles
- **Development of Flexible-fuel vehicles**. Started in **2003**
  - Automotive manufacturers introduced flex-fuel vehicles which can use any mixture of **gasoline and alcohol**

# Brazil – ...by changing the vehicle fleet...

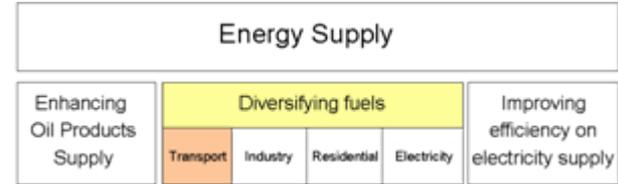

**Brazilian Light Vehicles Market Sales**

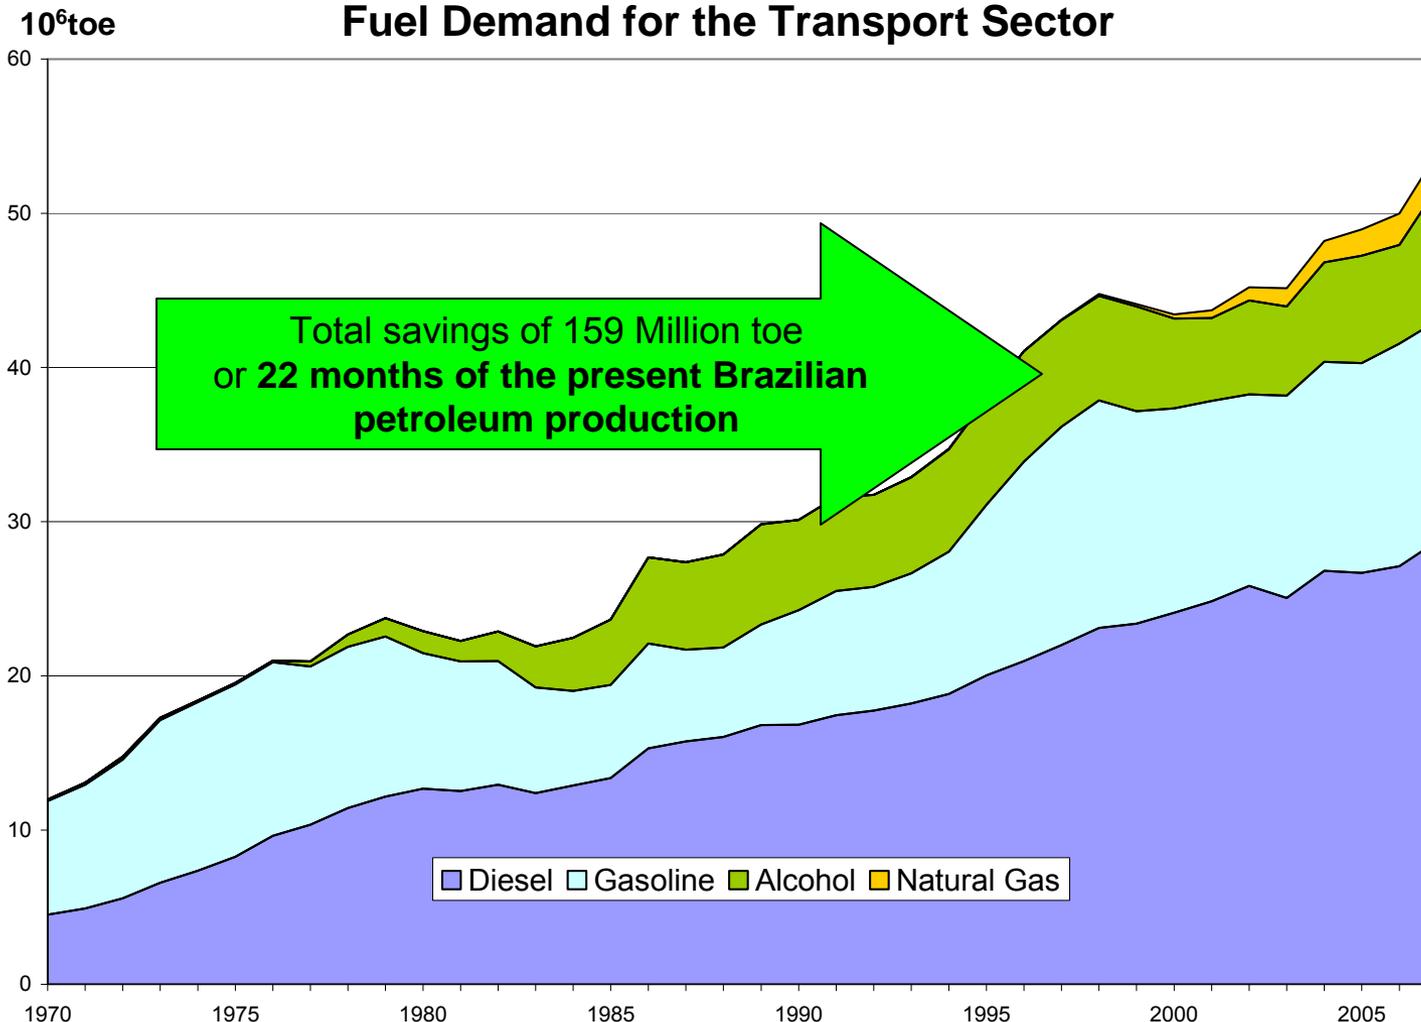

**Fleet Composition (Oct-08)**

- NGV: 6%
- Flex Fuel: 25%
- Alcohol: 4%
- Diesel/Gasoline: 65%

The market share of Diesel/Gasoline vehicles decreased by **35%**

## Brazil – ...with impressive results in the fuel consumption mix

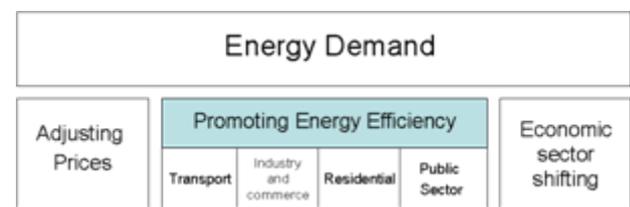

### Fuel composition (2007)

- Natural gas: 4%
- Alcohol: 16%
- Gasoline: 27%
- Diesel: 53%

**USAID**  
FROM THE AMERICAN PEOPLE

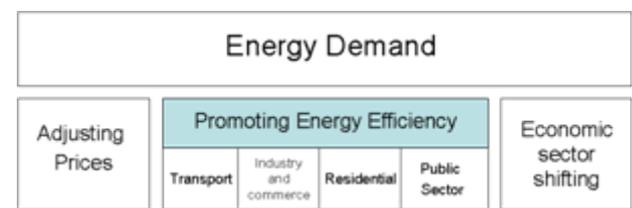

## Selected Success Stories

### Philippines - A successful Energy Efficiency (EE) Program...

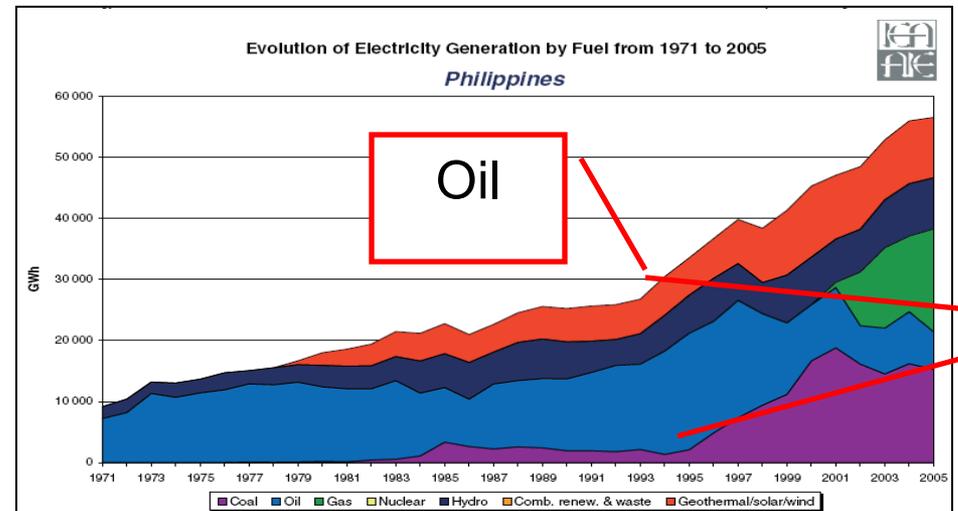

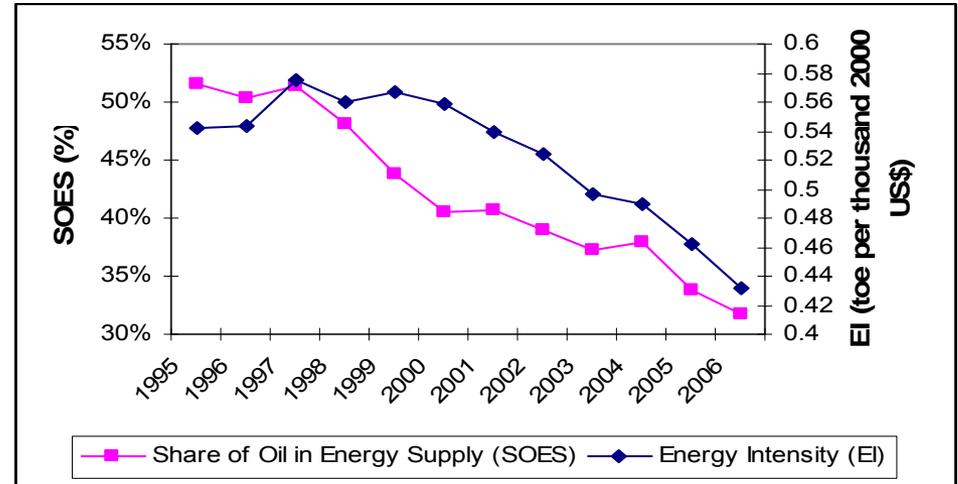

- In 1997, imported 80%+ of energy consumption, 51% oil-based.
- 2000 - 2004, the Department of Energy (DOE) launched several EE initiatives towards energy independence.
- **National EE Program** goals: average annual energy savings of 10% and reduction of 12% in oil imports over 10 years, through three key areas:
  - Alternative Fuels and Technologies (Transport and Electricity sector)
  - Electricity Efficiency and Conservation
  - Fuel Efficiency and Conservation (Transport and Industry sectors)
- The government took the lead through the **Government Energy Management Program**, goal of 10% reduction in its energy consumption

**...with remarkable results**

- **Energy Self-Sufficiency** ↑  
20% (1997) → 40% (2005)
- **Share of Oil in Energy Supply** ↓  
51% (1997) → 32% (2006)
- **Government Savings** under the energy conservation initiative  
23% in energy and 13% in fuel
- **Energy Intensity** ↓  
25% over the last decade, at a 3% annual rate

## **Successful interventions should consider the following dimensions**

### **Efficiency**

- Package of coordinated interventions increase the efficacy compared with single measures
- Each country needs to adapt the interventions to its own circumstances

### **Sequence**

- Incentive prices that reflect the real costs: A condition for successful energy interventions
- Need of a favorable and stable institutional framework

### **Timeline**

- Energy sector reform takes time to implement
- There are interventions that have an impact in the short term (e.g. DSM programs) and other in the long term (e.g. Renewable energy projects)

**USAID**  
FROM THE AMERICAN PEOPLE

## Outline

- Objective
- The Energy Challenge
- Key Interventions
- Selected Success Stories
- **Coping with the Energy Challenge: A Toolkit**
- Conclusion

**USAID**  
FROM THE AMERICAN PEOPLE

## Coping with the Energy Challenge: A Toolkit

A comprehensive toolkit to help USAID missions design programs with effective approaches to cope with higher oil prices in their countries by:

- **Assessing** and measuring the **vulnerability** of a country to a high oil price scenario
- Identifying the most **critical areas** affected by higher oil prices
- Providing a **menu of effective interventions** linked to those critical areas in selected sectors
- Providing an extensive **reference bibliography** to support the design of the selected interventions
- Illustrating the program implementation with **case studies** of successful interventions

**USAID**  
FROM THE AMERICAN PEOPLE

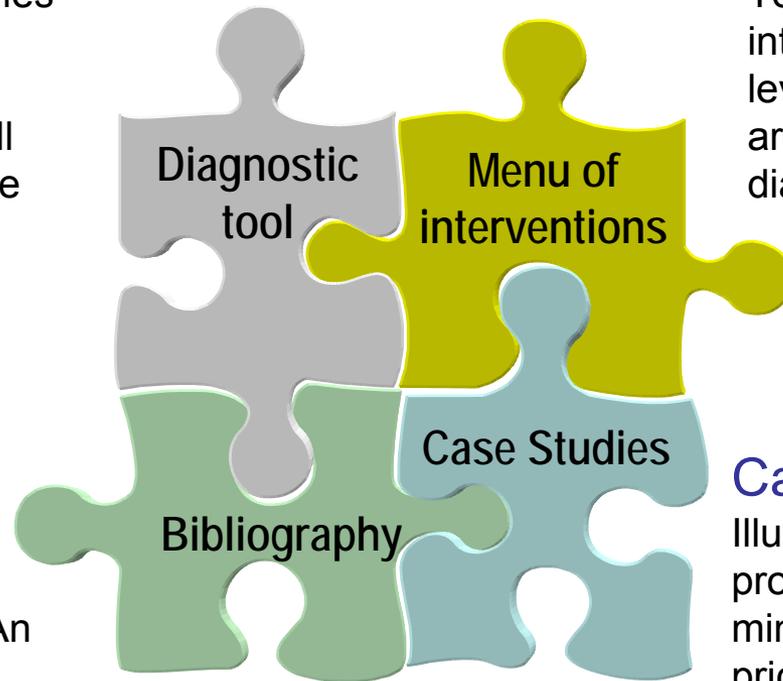

## Coping with the Energy Challenge: A Toolkit

### Diagnostic Tool

Measures the vulnerability to high oil prices through a series of key indicators. By comparing them with reference levels, the tool will highlight the most vulnerable sectors of the country.

### Bibliography

Provides references from the literature on the various interventions of the menu. An hyperlink will connect the menu of interventions with a brief description of the document and to the full report in the CD

### Menu of Interventions

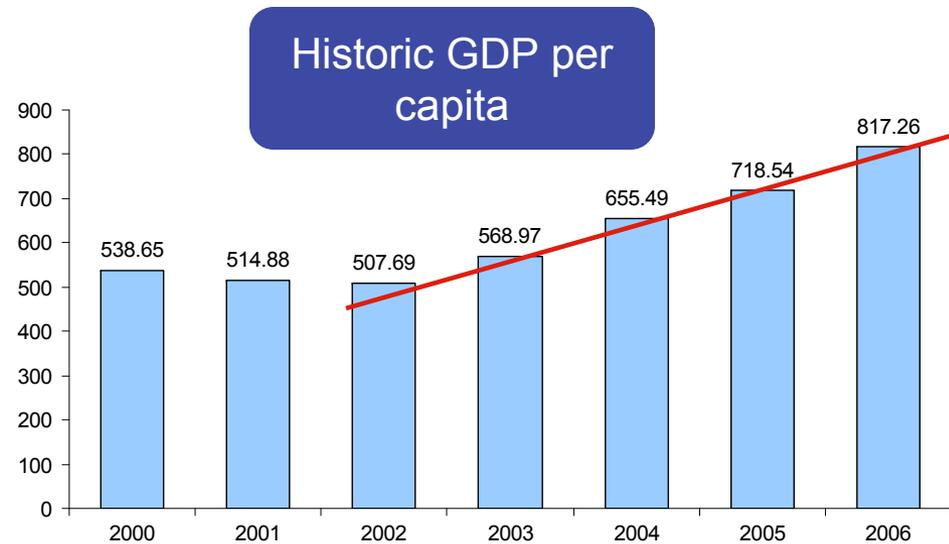

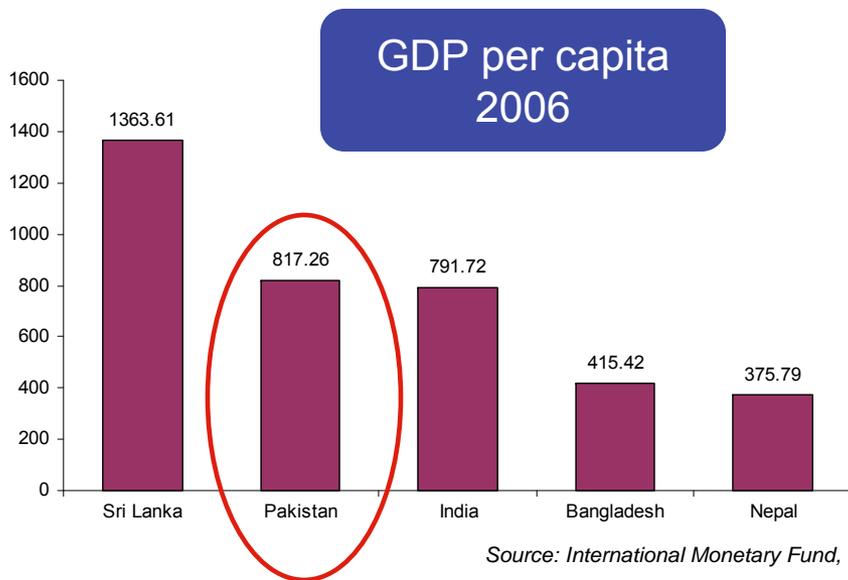

Linked with the Diagnostic Tool, provides effective interventions at different levels of detail to the critical areas identified in the diagnostic tool

### Case Studies

Illustrate projects that proved successful in minimizing the impact of high oil prices. They will also identify key factors underlying a set of interventions to be successful in a given country

### Using Pakistan as an example- **Economic** dimension indicators

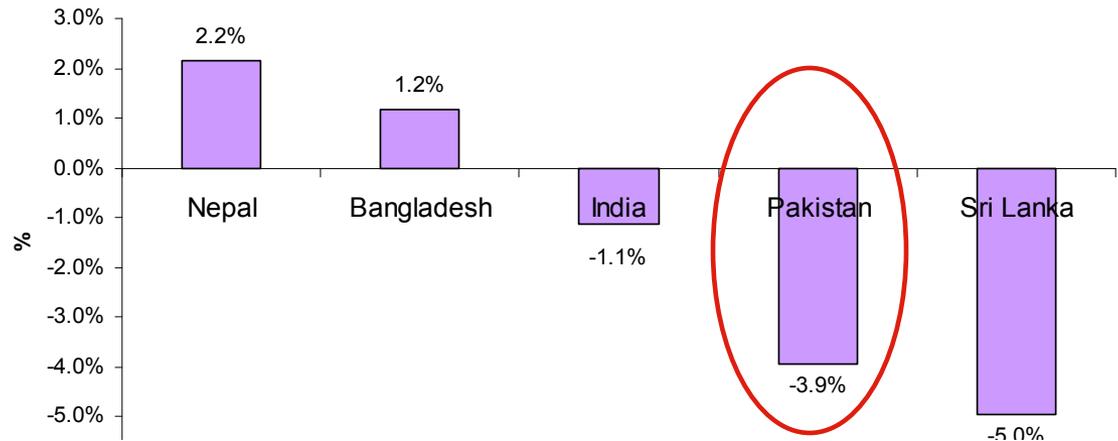

Pakistan's economic engine is relatively strong with respect to peers in region, and recovering rapidly since 2002

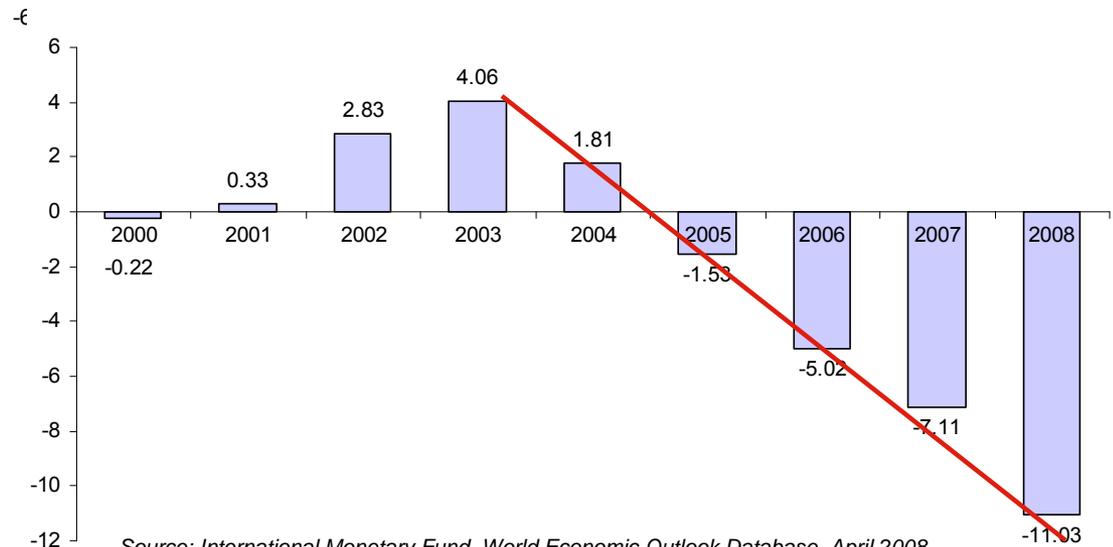

...but its current account balance is **deteriorating** rapidly, making it very difficult to absorb impacts of high oil prices....

Current account balance in 2006 as % of GDP

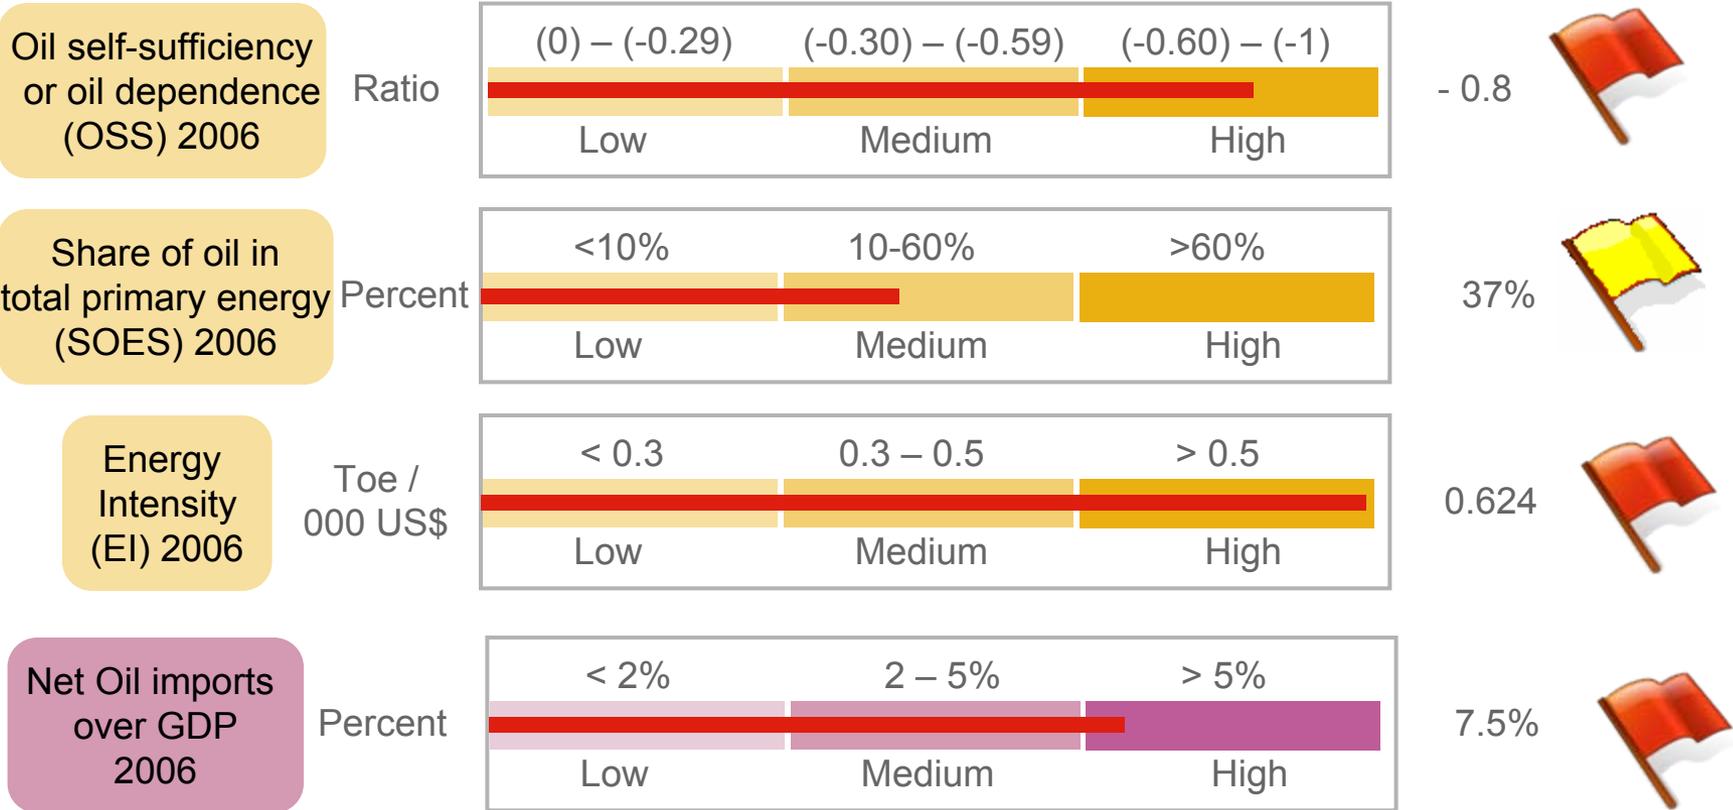

Historic current account balance

Source: International Monetary Fund, World Economic Outlook Database, April 2008

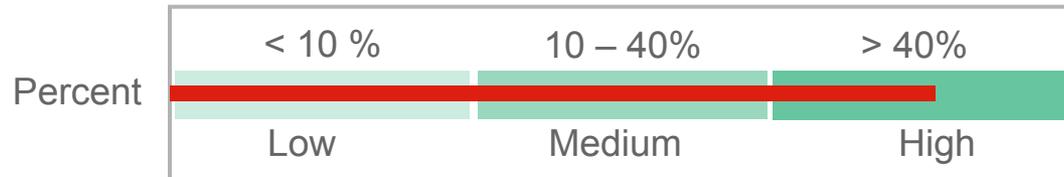

**...Pakistan's energy market indicators do not help and are contributing to balance deficits and slowing down economic growth**

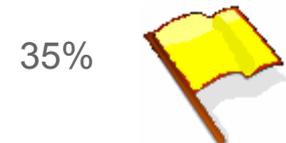

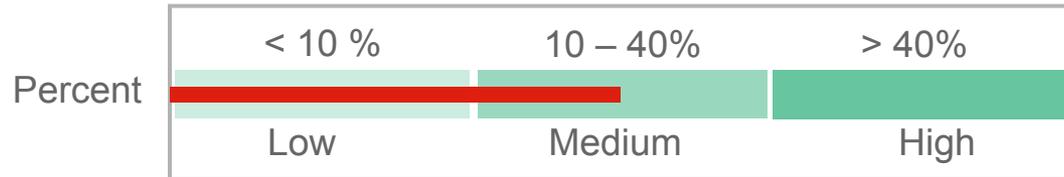

### ... **sub-sector indicators** identify key areas where interventions will have a greater impact in reducing Pakistan's vulnerability

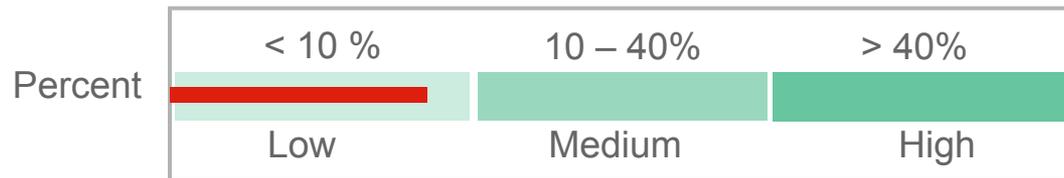

Share of oil for **transport** uses in Oil Con. 2006

Share of oil for **electricity** in Oil Con. 2006

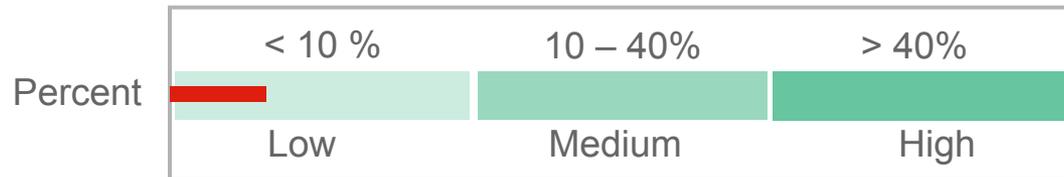

Share of oil for **industry** in Oil Con. 2006

9%

Share of oil for **households** in Oil Con. 2006

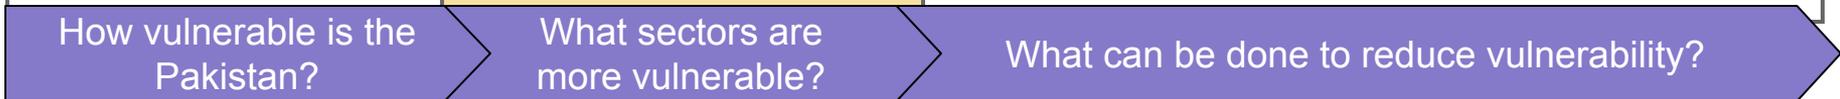

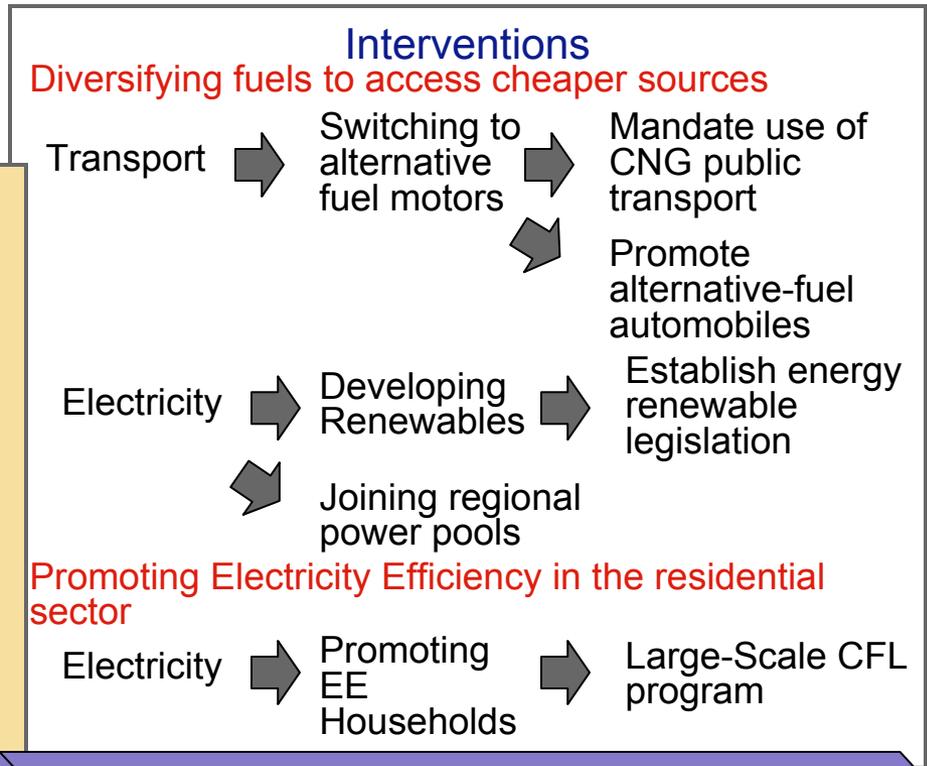

3%

**...based on Pakistan’s vulnerability and sub-indicators encountered, the following interventions would minimize impacts of high oil prices**

Condition:	Indicator:
Heavy oil importer	OSS: -0.8
Significant Oil Con. on TPES	SOES: 37%
High energy intensity	EI: 0.624

Condition:	Indicator:
Heavy consumption of oil in <b>transport</b> sector	47%
Medium consumption of oil in <b>electricity</b> sector	35%
<b>Heavy Concentration of electricity con. In residential</b>	46%

**USAID**  
FROM THE AMERICAN PEOPLE

## Outline

- Objective
- The Energy Challenge
- Key Interventions
- Selected Success Stories
- Coping with the Energy Challenge: A Toolkit
- Conclusion

- **Energy is critical for development** and affects almost all other sectors
- Most **USAID-assisted countries** are oil-importing and **affected** by the current **energy-challenge**
- There are **interventions** that can help to meet the energy challenge
- USAID/EGAT developed a **toolkit** to help diagnose key problem areas and identify potential interventions
- The **Energy Team** is available to **assist Missions** in assessing the energy challenge and developing programs to address challenges.
